

Grid Loss: Detecting Occluded Faces

Michael Opitz Georg Waltner Georg Poier Horst Possegger Horst Bischof Graz University of Technology, Institute for Computer Graphics and Vision, Austria

Motivation and Contribution **Robustness to Occlusions** • Parts are discriminative alone. Recent benchmark evaluations • If subset of parts fail (due to occlusion), detection can recover. FDDB [2]) show that (e.g. standard CNN detectors fail on Method COFW-HO COFW-LO occluded faces. Grid Loss 0.979 0.998Standard Loss 0.909 0.982 • State-of-the-art approaches rely True Positive Rate on COFW Heavily Occluded (COFW-HO) and Less on large pre-trained ImageNet Occluded (LO) subsets with our loss vs standard loss. models, e.g. [1], and on large datasets with face-attribute an-**Diversity of Learned Features** notations to re-rank object proposals [4]. • More diverse features compared to We show that simple CNN based standard loss Method Correlation detectors trained from scratch • Prevents learning only a small subset 225.96 Grid Loss can outperform these methods, if of prominent features, e.g. eye. 22500.25 Standard Loss they handle occlusions properly. Correlation on feature maps • Encourages learning discriminative To this end, we train a part-based features for all sub-regions. CNN detector with our grid loss function. Standard Loss Grid Loss **Generalization Ability** Supplemental material is available online. 0.90 0.85 Positive • Better generalization ability, due to 0.80 larger diversity of features. Overview 0.75 True Hinge Loss 0.70 • On smaller training set sub-sets the RGB Input ACF Featur 4x4 Pooling 64x5x5 128x5x5 Pose-specific 0.8 0.6 0.4 0.2 0.0 1.0 Grid Loss \bigcirc 18 performance gap between Grid Loss Fraction of training set ŝ, Ť. and standard loss functions increases. \bigcirc Comparison of true positive rate 1 $\{ \downarrow \}$ with detectors trained on a subset Ć 6 of the dataset C Ľ Ec. Block, ί÷. 1 **Benchmark Results** 2 convolution layers on top of Aggregate Channel Features. • We achieve state-of-the art performance on several datasets. • Linear **pose-specific classifiers** on top of the last convolution layer. 0.95 • At test time: fully convolutional detection over an image pyramid. 0.90 0.9 • Regressor to refine location of detected faces. 5 0.8 0.85 Ne. • To tackle occlusions we look at spatially non-overlapping blocks on the Posit 0.7 0.80 last convolution layer. 0.75 0.6 Grid loss optimizes a loss on each of these blocks separately. 0.70 0.5L 0.5 0.9 200 400 600 800 0.7 0.8 1000 0.6 10 Recall False Positives Loss Function Ours Big (AP 93.49) Faceness [ICCV'15] (AP 92.11) DDFD [ICMR'15] (AP 91.79) Ours Fast (AP 90.89) DPM [ECCV'14] (AP 90.29) HeadHunter [ECCV'14] (AP 89.63) Struct.
